Bench-bench ganging

Arrange the benches into the desired configuration, align the benches so they are flush with one another. Locate the ganging ports on the underside of the benches and line the ganging plate up with these ports. Insert (x4) hex machine screws 5/16–18 x 1 1/4", first tightening the screw by hand to ensure the screw is threading correctly, then use a driver gun to complete.

Bench-table ganging

Locate the ganging ports on the underside of the bench and insert (x2) hex machine screw 5/16–18 x 1 1/4", first tightening the screw by hand to ensure the screw is threading correctly, then use a driver gun to complete.

Ganging Visit tables and benches with power

For configurations that contain tables with power, a power cord runs along the underside of the benches and tables, connecting at a power bar at the ganging plate.

To affix the power bar to the ganging plate, line up the power bar clip to the slots in the center of the ganging plate and fasten to the plate using an adjustable wrench or socket and 2 hex screws.
Once the power bar clip is in place, clip in the power bar to hold it in place. Plug the power cord that is integrated into the bench into the power bar. If multiple powered benches are ganged together in a configuration, ensure all benches are connected through the power cord and bar.

To power the Visit table, plug the table power unit into the power bar. For in-line tables, the power can be drawn from the bench on either side, providing flexibility to adapt to the location of the power source.

To manage the power cord at the end of a configuration, use 2 wood screws and screw a power bar clip into the underside of the bench. The clip can be screwed in any orientation or location under the bench, to accommodate differing power source locations.

Fit the power bar into the clip. Plug the cord into a wall outlet to power the configuration.
